July 5, 2024

## 1 Issue 6 (Additional keyword argument to MAKE-PACKAGE)

### 1.1 Current behavior

sbcl, ccl, abcl, clasp, lispworks: no additional key argument.

ecl: has an additional keyword argument `:local-nicknames`, but it is undocumented and it segfaults on incorrect usage. The expected value is a list of conses: `((nickname . package)*)`.

acl: has an additional keyword argument `:local-nicknames`. The expected value is a list of lists: `((nickname package)*)`.

### 1.2 Proposal EXTRA-KEYWORD-ARGUMENT

Add `:local-nicknames` keyword argument to `make-package`:

`local-nicknames ::= ((nickname package)*)`

`nickname` must be a *string designator*. `package` must be a *package designator*.

`local-nicknames` defaults to an *empty list*.

See `make-package`.
