1 Issue 7 (Multiple local nicknames)

1.1 Description

It is not clear whether `package-locally-nicknamed-by-list` should be allowed to return lists with
duplicate entries (when there are multiple local nicknames in one package).

1.2 Examples

```
(defpackage #:foo
  (:use)
  (:local-nicknames (#:bar #:cl)
                    (#:baz #:cl)))
(mapcar #'package-name (package-locally-nicknamed-by-list '#:cl))
; => ("FOO")  (sbcl, acl, clasp, lispworks)
; => ("FOO" "FOO")  (ccl, ecl, abcl)
```

1.3 Current behavior

sbcl, acl, clasp, lispworks: `package-locally-nicknamed-by-list` never contains duplicate entries.
ccl, abcl, ecl: `package-locally-nicknamed-by-list` might contain duplicate entries.

1.4 Proposal NO-DUPLICATES

`package-locally-nicknamed-by-list` must return a list without duplicate entries.
