1 Issue 6 (Additional keyword argument to MAKE-PACKAGE)

1.1 Current behavior

sbcl, ccl, abcl, clasp, lispworks: no additional key argument.

ecl: has an additional keyword argument `:local-nicknames`, but it is undocumented and it segfaults on incorrect usage. The expected value is a list of conses: `((nickname . package)*)`.

acl: has an additional keyword argument `:local-nicknames`. The expected value is a list of lists: `((nickname package)*)`.

1.2 Proposal EXTRA-KEYWORD-ARGUMENT

Add `:local-nicknames` keyword argument to `make-package`:

```
local-nicknames ::= ((nickname package)*)
```

`nickname` must be a *string designator*. `package` must be a *package designator*.
`local-nicknames` defaults to an *empty list*.
See make-package.
